

# Homework 1. Due Wednesday, August 26, 9:20 am.

**Problem 1.** *Problem 1.6 from Classical Mechanics by J. R. Tylor*

By evaluating their dot product, find the values of the scalar  $s$  for which the two vectors  $\vec{b} = \hat{x} + s\hat{y}$  and  $\vec{c} = \hat{x} - s\hat{y}$  are orthogonal. (Remember that two vectors are orthogonal if and only if their dot product is zero.) Explain your answers with a sketch.

**Problem 2.** *Problems 1.8 from Classical Mechanics by J. R. Tylor*

1. Use the definition  $\vec{r} \cdot \vec{s} = r_1s_1 + r_2s_2 + r_3s_3$  to prove that the scalar product is distributive; that is, that  $\vec{r} \cdot (\vec{u} + \vec{v}) = \vec{r} \cdot \vec{u} + \vec{r} \cdot \vec{v}$ .
2. If  $\vec{r}$  and  $\vec{s}$  are vectors that depend on time, prove that the product rule for differentiating products applies to  $\vec{r} \cdot \vec{s}$ , that is, that

$$\frac{d}{dt}(\vec{r} \cdot \vec{s}) = \vec{r} \cdot \frac{d\vec{s}}{dt} + \frac{d\vec{r}}{dt} \cdot \vec{s}.$$

**Problem 3.** *Problem 1.10 from Classical Mechanics by J. R. Tylor*

A particle moves in a circle (center  $O$  and radius  $R$ ) with constant angular velocity  $\omega$  counterclockwise. The circle lies in the  $x - y$  plane and the particle lies on the  $x$  axis at time  $t = 0$ .

1. Show that the particle's position is given by

$$\vec{r}(t) = \hat{x}R \cos(\omega t) + \hat{y}R \sin(\omega t).$$

2. Find the particle's velocity and acceleration. What is the magnitude and the direction of the acceleration? Relate your answers to the well-known properties of uniform circular motion.

**Problem 4.** *Problem 1.17 from Classical Mechanics by J. R. Tylor*

1. Prove that the vector product  $\vec{r} \times \vec{s}$  (as defined by the following  $\vec{p} = \vec{r} \times \vec{s}$  means  $p_x = r_y s_z - r_z s_y$ ,  $p_y = r_z s_x - r_x s_z$ ,  $p_z = r_x s_y - r_y s_x$ ) is distributive; that is, that  $\vec{r} \times (\vec{u} + \vec{v}) = \vec{r} \times \vec{u} + \vec{r} \times \vec{v}$ .
2. If  $\vec{r}$  and  $\vec{s}$  are vectors that depend on time, prove that the product rule for differentiating products applies to  $\vec{r} \times \vec{s}$ , that is, that

$$\frac{d}{dt}(\vec{r} \times \vec{s}) = \vec{r} \times \frac{d\vec{s}}{dt} + \frac{d\vec{r}}{dt} \times \vec{s}.$$

Be careful with the order of the factors.

**Problem 5.** *Problem 1.19 from Classical Mechanics by J. R. Tylor*

If  $\vec{r}$ ,  $\vec{v}$ ,  $\vec{a}$  denote the position, velocity, and acceleration of a particle, prove that

$$\frac{d}{dt}[\vec{a} \cdot (\vec{v} \times \vec{r})] = \dot{\vec{a}} \cdot (\vec{v} \times \vec{r}).$$

**Problem 6.** *Problem 1.23 from Classical Mechanics by J. R. Tylor*

The unknown vector  $\vec{v}$  satisfies  $\vec{b} \cdot \vec{v} = \lambda$  and  $\vec{b} \times \vec{v} = \vec{c}$ , where  $\lambda$ ,  $\vec{b}$ , and  $\vec{c}$  are fixed and known. Find  $\vec{v}$  in terms of  $\lambda$ ,  $\vec{b}$ , and  $\vec{c}$ .

## Homework 2. Due September 2, at 9:20 am.

### Problem 1. *Rising Snake*

A snake of length  $L$  and linear mass density  $\rho$  rises from the table. Its head is moving straight up with the constant velocity  $v$ . What force does the snake exert on the table?

### Problem 2. *1983-Spring-CM-U-1.*

A ball, mass  $m$ , hangs by a massless string from the ceiling of a car in a passenger train. At time  $t$  the train has velocity  $\vec{v}$  and acceleration  $\vec{a}$  in the same direction. What is the angle that the string makes with the vertical? Make a sketch which clearly indicates the relative direction of deflection.

### Problem 3. *1984-Fall-CM-U-1.*

Sand drops vertically from a stationary hopper at a constant rate of 100 gram per second onto a horizontal conveyor belt moving at a constant velocity,  $\vec{v}$ , of 10 cm/sec.

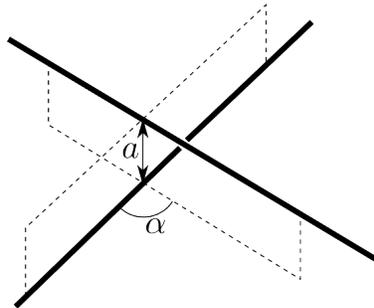

1. What force (magnitude and direction relative to the velocity) is required to keep the belt moving at a constant speed of 10 cm/sec?
2. How much work is done by this force in 1.0 second?
3. What is the change in kinetic energy of the conveyor belt in 1.0 second due to the additional sand on it?
4. Should the answers to parts 2. and 3. be the same? Explain.

### Problem 4. *1994-Fall-CM-U-1*

Two uniform very long (infinite) rods with identical linear mass density  $\rho$  do not intersect. Their directions form an angle  $\alpha$  and their shortest separation is  $a$ .

1. Find the force of attraction between them due to Newton's law of gravity.
2. Give a dimensional argument to explain why the force is independent of  $a$ .

Note: for  $A^2 < 1$ ,  $\int_{-\pi/2}^{\pi/2} \frac{d\theta}{1-A^2 \sin^2 \theta} = \frac{\pi}{\sqrt{1-A^2}}$

## Homework 3. Due September 9, at 9:20 am.

### Problem 1. *Height for quadratic friction.*

A body of mass  $m$  was thrown straight up with initial velocity  $v_0$ . The force of the air resistance is  $-\gamma v|v|$

- How long will it take for the body to reach the top of its trajectory?
- What the answer will be if  $\gamma \rightarrow 0$ .
- How long it will take for the body to reach the top of its trajectory if initial velocity is infinite?
- For finite initial velocity, how far up the body will go?
- What the answer will be if  $\gamma \rightarrow 0$ .

[Hint:  $\int \frac{dx}{x^2+1} = \tan^{-1}(x)$ ,  $\int \tan(x)dx = -\log(\cos(x))$ ,  $\cos(\tan^{-1}(x)) = \frac{1}{\sqrt{1+x^2}}$ .]

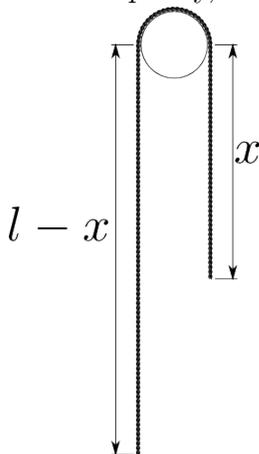

### Problem 2. *Hole of Earth.*

Assume that the earth is a sphere, radius  $R$  and uniform mass density,  $\rho$ . Suppose a shaft were drilled all the way through the center of the earth from the north pole to the south. Suppose now a bullet of mass  $m$  is fired from the center of the earth, with velocity  $v_0$  up the shaft. Assuming the bullet does not go beyond the earth's surface and neglecting the air resistance

- calculate in what time the bullet will return back?
- how does this time depend on  $v_0$ ?
- how does this time depend on  $m$ ?

### Problem 3. *Rope*

A simple Atwood's machine consists of a heavy rope of length  $l$  and linear density  $\rho$  hung over a pulley (see Fig.). Neglecting the part of the rope in contact with the pulley, and the mass of the pulley, find  $x(t)$  if the initial conditions are  $x(t=0) = l/2$  and  $v(t=0) = v_0$ .

**Problem 4.** *Problem 5.44 from Classical Mechanics by J. R. Tylor*

Another interpretation of the quality factor  $Q$  of a resonance comes from the following: Consider a motion of a driven damped oscillator (damping force  $F_{dmp} = -2\beta mv$ ) after any transients have died out, and suppose that it is being driven close to resonance, so you can set  $\omega = \omega_0$ , where  $\omega$  is the frequency of the force and  $\omega_0$  is the natural frequency of the oscillator.

1. Show that the oscillator's total energy (kinetic plus potential) is  $E = \frac{1}{2}m\omega^2 A^2$ , where  $A$  is the amplitude.
2. Show that the energy  $\Delta E_{dis}$  dissipated during one cycle by the damping force  $F_{dmp}$  is  $2\pi m\beta\omega A^2$ . (Remember that the rate at which a force does work is  $Fv$ .)
3. Hence show that  $Q$  is  $2\pi$  times the ratio  $E/\Delta E_{dis}$ .

**Problem 5. Extra for Honors**

Plot coordinate vs. time for an overdamped oscillator with initial conditions  $x(t = 0) = 0$ ,  $v(t = 0) = v_0$ .

- What is the slope of the graph at  $t = 0$ ?
- What is the dependence of coordinate on time at  $t \rightarrow \infty$ ?
- Find the general solution for the damped oscillator in the case  $\gamma = \omega_0$ . Hint: The solution must still have two independent constants.

## Homework 4. Due September 16, at 9:20 am.

### Problem 1. *Bucket*

A weightless bucket which initially contains mass  $m_0$  of water is being drawn up a well by a rope which exerts a steady force  $P = m_0g$  on the bucket. Initially the bucket is at rest. The water leaks out of the bucket at a constant rate, so that after a time  $T$ , before the bucket reaches the top, the bucket is empty. Find the velocity of the bucket just at the instant it becomes half empty. Express your answer in terms of  $T$ , and  $g$ , the acceleration due to gravity.

### Problem 2. *1985-Spring-CM-U-3.*

A damped one-dimensional linear oscillator is subjected to a periodic driving force described by a function  $F(t)$ . The equation of motion of the oscillator is given by

$$m\ddot{x} + b\dot{x} + kx = F(t),$$

where  $F(t)$  is given by

$$F(t) = F_0 (1 + \sin(\omega t)).$$

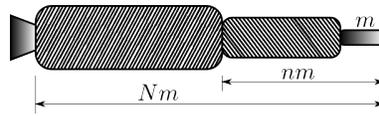

The driving force frequency is  $\omega = \omega_0$  and the damping by  $b/2m = \omega_0$ , where  $\omega_0^2 = k/m$ . At  $t = 0$  the mass is at rest at the equilibrium position, so that the initial conditions are given by  $x(0) = 0$ , and  $\dot{x}(0) = 0$ . Find the solution  $x(t)$  for the position of the oscillator vs. time.

### Problem 3. *1994-Fall-CM-U-2*

Suppose that the payload (e.g., a space capsule) has mass  $m$  and is mounted on a two-stage rocket (see figure below). The total mass — both rockets fully fueled, plus the payload — is  $Nm$ . The mass of the second-stage plus the payload, after first-stage burnout and separation, is  $nm$ . In each stage the ratio of burnout mass (casing) to initial mass (casing plus fuel) is  $r$ , and the exhaust speed is  $v_0$ .

1. Find the velocity  $v_1$  gained from first-stage burn starting from rest (and ignoring gravity). Express your answer in terms of  $v_0$ ,  $N$ ,  $n$ , and  $r$ .
2. Obtain a corresponding expression for the additional velocity,  $v_2$  gained from the second-stage burn.

3. Adding  $v_1$  and  $v_2$ , you have the payload velocity  $v$  in terms of  $N$ ,  $n$ ,  $v_0$ , and  $r$ . Taking  $N$ ,  $v_0$ , and  $r$  as constants, find the value for  $n$  for which  $v$  is a maximum.
4. Show that the condition for  $v$  to be a maximum corresponds to having equal gains of velocity in the two stages. Find the maximum value of  $v$ , and verify that it makes sense for the limiting cases described by  $r = 0$  and  $r = 1$ .
5. You need to build a system to obtain a payload velocity of 10km/sec, using rockets for which  $v_0 = 2.5\text{km/sec}$  and  $r = 0.1$ . Can you do it with a two-stage rocket?
6. Find an expression for the payload velocity of a single-stage rocket with the same values of  $N$ ,  $r$ , and  $v_0$ . Can you do it with a single-stage rocket by taking the same conditions as in the previous point?

**Problem 4.** *Hovering rocket*

How the rocket should burn its fuel (what is  $m(t)$ ) in order to hover in the Earth gravitational field close to the Earth surface.

## Homework 5. Due September 23, at 9:20 am.

### Problem 1. *Tensor of inertia.*

In the frame where the tensor of inertia is diagonal calculate it for:

1. A uniform disc of mass  $m$  and radius  $R$ .
2. A uniform solid (not hollow) sphere of mass  $m$  and radius  $R$ .
3. A thin stick of length  $L$  and mass  $m$ , if the origin is at one end of the stick.
4. A thin stick of length  $L$  and mass  $m$ , if the origin is at the center of the stick.

*You have to show how you compute them. Just copying the answers from Wikipedia is not enough.*

### Problem 2. *1989-Spring-CM-U-2.*

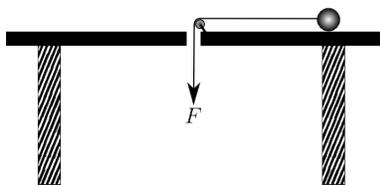

A platform is free to rotate in the horizontal plane about a frictionless, vertical axle. About this axle the platform has a moment of inertia  $I_p$ . An object is placed on a platform a distance  $R$  from the center of the axle. The mass of the object is  $m$  and it is very small in size. The coefficient of friction between the object and the platform is  $\mu$ . If at  $t = 0$  a torque of constant magnitude  $\tau_0$  about the axle is applied to the platform when will the object start to slip?

### Problem 3. *A ball on a string.*

A ball is on a frictionless table. A string is connected to the ball as shown in the figure. The ball is started in a circle of radius  $R$  with angular velocity  $\omega_0$ . The force exerted on a string is then increases so that the distance between the hole and the ball decreases and is a given function of time  $r(t)$ . Assuming the string stays straight and that it only exerts a force parallel to its length.

1. Find the velocity of the ball as a function of time.
2. What is polar  $\phi$  component of the force must be in order for this motion to be possible?

[**Hint:** This question means that as from the previous question you know the full motion of the ball, you need to find the  $\phi$  component of the acceleration and from it find the  $\phi$  component of the force.]

**Extra for Honors**

**Problem 4.** *1990-Spring-CM-U-2.*

A uniform rod, of mass  $m$  and length  $2l$ , is freely rotated at one end and is initially supported at the other end in a horizontal position. A particle of mass  $\alpha m$  is placed on the rod at the midpoint. The coefficient of static friction between the particle and the rod is  $\mu$ . If the support is suddenly removed:

1. Calculate by what factor the force on the hinge is instantaneously reduced?
2. The particle begins to slide when the falling rod makes an angle  $\theta$  with the horizontal. Calculate this angle.

**[Hint:** To do this part, you need both components of the force equation on the mass  $\alpha m$ ; plus the torque equation and the equation for the conservation of the energy of the whole system.]

## Homework 6. Due September 30, at 9:20 am.

### Problem 1. 1991-Spring-CM-U-3.

A uniform sphere with a mass  $M$  and radius  $R$  is set into rotation with a horizontal angular velocity  $\omega_0$ . At  $t = 0$ , the sphere is placed without bouncing onto a horizontal surface as shown. There is friction between the sphere and the surface. Initially, the sphere slips, but after an unknown time  $T$ , it rolls without slipping.

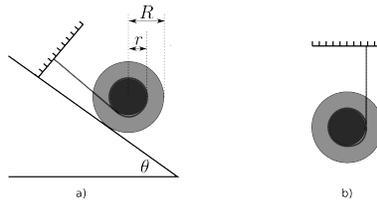

1. What is the angular speed of rotation when the sphere finally rolls without slipping at time  $T$ ?
2. How much energy is lost by the sphere between  $t = 0$  and  $t = T$ ?
3. Show that amount of energy lost is equal to the work done against friction causing the sphere to roll without slipping?

### Problem 2. 1993-Fall-CM-U-2.

A “Yo-Yo” (inner and outer radii  $r$  and  $R$ ) has mass  $M$  and moment of inertia about its symmetry axis  $Mk^2$ .

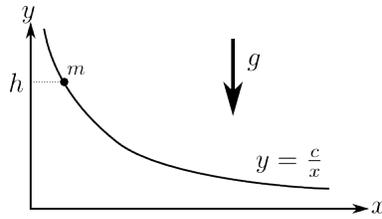

1. The Yo-Yo is attached to a wall by a massless string and located on the slope as shown in Fig. a). The coefficient of static friction between the slope and Yo-Yo is  $\mu$ . Find the largest angle  $\theta$  before the Yo-Yo starts moving down.
2. Now, consider Yo-Yo which is falling down as shown in Fig. b). Find the ratio of its translational and rotational kinetic energies.

### Problem 3. 1994-Spring-CM-U-3

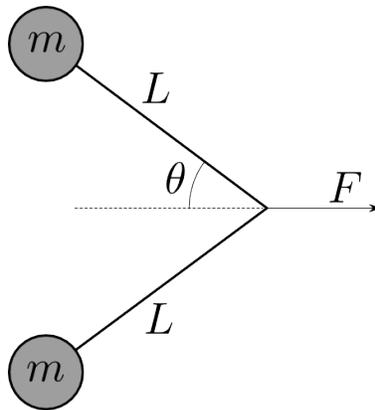

A wire has the shape of a hyperbola,  $y = c/x$ ,  $c > 0$ . A small bead of mass  $m$  can slide without friction on the wire. The bead starts at rest from a height  $h$  as shown in the figure

1. Find the velocity vector  $\vec{v}$  of the bead as a function of  $x$ .
2. Find the force  $\vec{F}$  that the bead exerts on the wire as a function of  $x$ .

**Problem 4.** 1996-Fall-CM-U-1

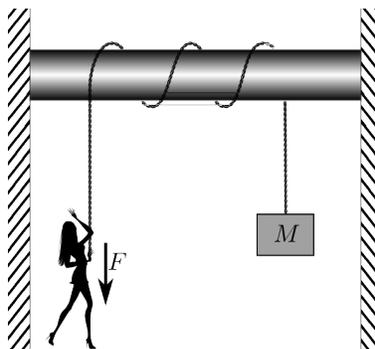

Two pucks, each of mass  $m$ , are connected by a massless string of length  $2L$  as illustrated below. The pucks lie on a horizontal, frictionless sheet of ice. The string is initially straight (*i.e.*,  $\theta = 90^\circ$ ). A constant, horizontal force  $F$  is applied to the middle of the string in a direction perpendicular to the line joining the pucks. When the pucks collide, they stick together. How much mechanical energy is lost in the collision?

**Extra for Honors**

**Problem 5.** 1994-Spring-CM-U-4

A person wants to hold up a large object of mass  $M$  by exerting a force  $F$  on a massless rope. The rope is wrapped around a fixed pole of radius  $R$ . The coefficient of friction between the rope and the pole is  $\mu$ . If the rope makes  $n + 1/2$  turns around the pole, what is the maximum weight the person can support?

## Homework 7. Due October 7, at 9:20 am.

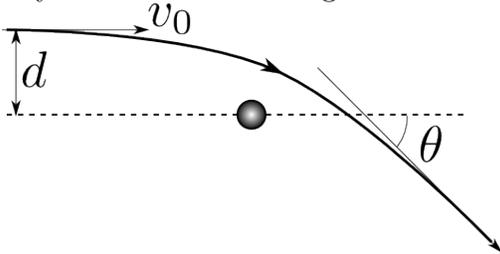

### Problem 1. *Kepler orbits.*

The shape of the Kepler's orbits (bounded and unbounded) is defined by its eccentricity  $\epsilon$ . Find the shape (its equation in the Cartesian coordinates) for

1.  $\epsilon = 0$ .
2.  $0 < \epsilon < 1$ .
3.  $\epsilon = 1$ . What is the energy  $E$  of the body?
4.  $\epsilon > 1$ .

### Problem 2. *Scattering.*

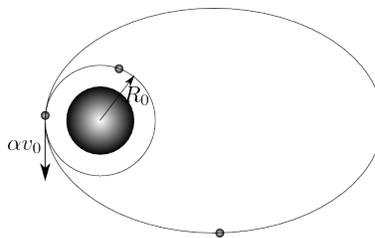

A comet is approaching the sun. Its velocity at infinity was  $v_0$ . The impact parameter at infinity was  $d$ . Find the angle of deflection  $\theta$ .

### Problem 3. *1990-Fall-CM-U-2.jpg*

An artificial Earth satellite is initially orbiting the earth in a circular orbit of radius  $R_0$ . At a certain instant, its rocket fires for a negligibly short period of time. This firing accelerates the satellite in the direction of motion and increases its velocity by a factor of  $\alpha$ . The change of satellite mass due to the burning of fuel can be considered negligible.

1. Let  $E_0$  and  $E$  denote the total energy of the satellite before and after the firing of the rocket. Find  $E$  solely in terms of  $E_0$  and  $\alpha$ .
2. For  $\alpha > \alpha_{\text{es}}$  the satellite will escape from earth. What is  $\alpha_{\text{es}}$ ?
3. For  $\alpha < \alpha_{\text{es}}$  the orbit will be elliptical. For this case, find the maximum distance between the satellite and the center of the earth,  $R_{\text{max}}$ , in terms of  $R_0$  and  $\alpha$ .

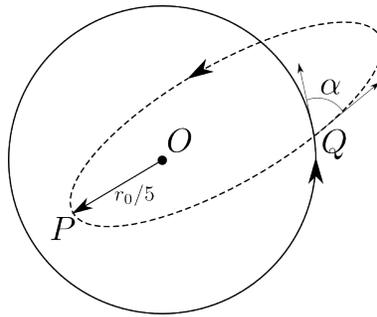

## Homework 8. Due October 14, at 9:20 am.

### Problem 1. 1993-Fall-CM-U-1

A satellite of mass  $m$  is traveling at speed  $v_0$  in a circular orbit of radius  $r_0$  under the gravitational force of a fixed mass  $M$  at point  $O$ . At a certain point  $Q$  in the orbit (see the figure below) the direction of motion of the satellite is suddenly changed by an angle  $\alpha$  without any change in the magnitude of the velocity. As a result the satellite goes into an elliptic orbit. Its distance of the closest approach to  $O$  (at point  $P$ ) is  $r_0/5$ .

1. What is the speed of the satellite at  $P$ , expressed as a multiple of  $v_0$ ?
2. Find the angle  $\alpha$ .

### Problem 2. 1994-Fall-CM-U-4

The most efficient way to transfer a spacecraft from an initial circular orbit at  $R_1$  to a larger circular orbit at  $R_2$  is to insert it into an intermediate elliptical orbit with radius  $R_1$  at perigee and  $R_2$  at apogee. The following equation relates the semi-major axis  $a$ , the total energy of the system  $E$  and the potential energy  $U(r) = -GMm/r \equiv -k/r$  for an elliptical orbit of the spacecraft of mass  $m$  about the earth of mass  $M$ :

$$R_1 + R_2 = 2a = \frac{k}{|E|}.$$

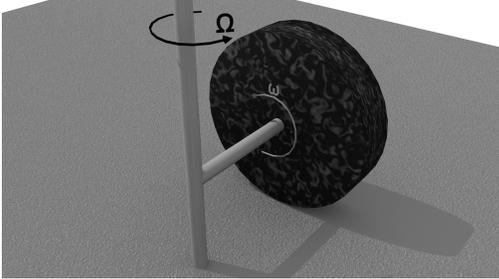

1. Derive the relation between the velocity  $v$  and the radius  $R$  for a circular orbit.
2. Determine the velocity increase required to inject the spacecraft into the elliptical orbit as specified by  $R_1$  and  $R_2$ . Let  $v_1$  be the velocity in the initial circular orbit and  $v_p$  be the velocity at perigee after the first boost so  $\Delta v = v_p - v_1$ .
3. Determine the velocity increment required to insert the spacecraft into the second circular orbit when it reaches apogee at  $r = R_2$ . In this case let  $v_2$  be the velocity in the final orbit and  $v_a$  be the velocity at apogee so  $\Delta v = v_2 - v_a$ .

**Problem 3.** *Problem 6.2 from Taylor*

Find the shortest path from point  $(R, z_1, \phi_1)$  to point  $(R, z_2, \phi_2)$  on a cylinder of radius  $R$  in cylindrical coordinates.

**Problem 4. Extra for Honors**

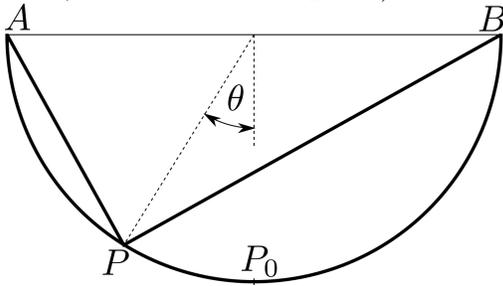

In a disk mill a massive cylinder of radius  $R$  and mass  $M$  can rotate around its geometrical axis. After the initial push it freely rotates with angular velocity  $\Omega$  around vertical axis and is rolling on the horizontal plate, as shown on the figure. What force the disk applies to the plate? The disk rolls without slipping.

## Homework 9. Due October 21, at 9:20 am.

**Problem 1.** *Problem 6.5 from Classical Mechanics by J. R. Tylor*

Consider a concave, hemispherical mirror with points  $A$  and  $B$  at opposite ends of a diameter. Consider a ray of light traveling in a vacuum from  $A$  to  $B$  with one reflection at a point  $P$ , in the same vertical plane as  $A$  and  $B$ . According to the law of reflection, the actual path goes via point  $P_0$  at the bottom of the hemisphere ( $\theta = 0$ ). Find the time of travel along the path  $APB$  as a function of  $\theta$  and show that it is a *maximum* at  $P = P_0$ ! (the correct statement of the Fermat's principle is that the time of travel for light must be *stationary* for arbitrary variation of the path.)

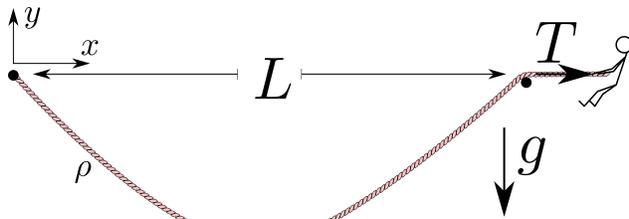

**Problem 2.** *Problem 6.22 from Classical Mechanics by J. R. Tylor*

You are given a string of fixed length  $l$  with one end fastened at the origin  $O$ , and you are to place the string in the  $xy$  plane with its other end on the  $x$  axis in such a way as to enclose the maximum area between the string and the  $x$  axis. Show, that the required shape is a semicircle. [See the problem 6.22 in Tylor for hints.]

**Problem 3.** *Problem 6.24 from Classical Mechanics by J. R. Tylor*

Consider a medium in which the refractive index is inversely proportional to  $r^2$ ; that is,  $n = a/r^2$ , where  $r$  is the distance from the origin. Use Fermat's principle to find the path of a ray of light traveling in a plane containing the origin. [See the problem 6.24 in Tylor for hints.]

**Problem 4.** **Extra for Honors** (*and fun for the rest of us.*)

A pink rope of linear mass density  $\rho$  is connected to a peg on the left and goes over a peg on the right. The pegs are on the same height distance  $L$  apart from each other. The force  $T$  is applied to the right end of the rope. There is no friction.  $y$  is the vertical coordinate pointing up, and  $x$  the is horizontal coordinate.

- Write down the functional of potential energy of the string vs. the shape of the string  $y(x)$ . Specify the boundary conditions for the function  $y(x)$ .

[**Hint:** You have two contributions to the potential energy. The first one is the gravi-

tational potential energy of the rope of shape  $y(x)$ , and the second one is the work one needs to do against the force  $T$  in order to be able to give the rope the shape  $y(x)$ .]

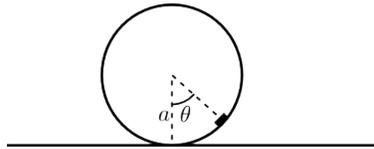

- Write down the equation which gives the shape of minimal energy for the string.
- Find the solution of the equation which satisfies the boundary conditions. (Do not try to solve the transcendental equation for one of the constants. Just write it down.)
- In the case  $T \gg \rho g L$ , the shape is approximately given by  $y \approx -\frac{\alpha}{2}x(L - x)$ . Find  $\alpha$ .

## Homework 10. Due October 28, at 9:20 am.

### Problem 1. 1991-Fall-CM-U-3.

A small block of mass  $m$  is attached near the outer rim of a solid disk of radius  $a$  which also has mass  $m$ . The disk rolls without slipping on a horizontal straight line.

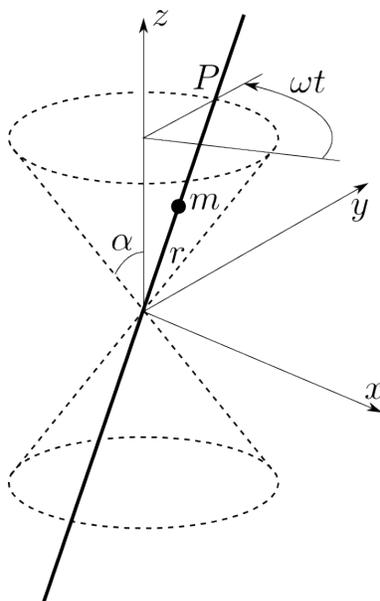

1. Find the equation of motion for the angle  $\theta(t)$  (measured with respect to the vertical as shown) for all  $\theta$ .
2. Find the system's small amplitude oscillation frequency about its stable equilibrium position.

### Problem 2. 1999-Spring-CM-U-2

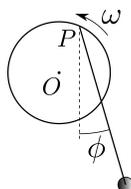

An infinitely long straight frictionless wire, which passes through the origin of the coordinate system, is held at a constant angle  $\alpha$  with respect to the (vertical)  $z$  axis. The wire rotates about the  $z$  axis at constant angular velocity  $\omega$ , so that it describes the surface of a pair of right circular cones, centered on the vertical axis, with their common vertices at the origin. Hence, an arbitrary point  $P$ , fixed on the wire, describes a horizontal circle as the wire rotates. A bead of mass  $m$  is free to slide along this wire under the influence of gravity and without friction. Let  $r$  be the distance of the bead from the apex of the cone, positive if above and negative if below the vertex.

1. Write the Lagrangian for this system in terms of  $r$ ,  $\alpha$ ,  $\omega$ ,  $m$ , and  $g$ .
2. From the Lagrangian, obtain the differential equation of motion for the bead.
3. Solve the equation of motion subject to the initial conditions that  $r = r_0$  and  $dr/dt = 0$  at  $t = 0$ . Find the condition on  $r_0$  which determines whether the bead will rise or fall on the wire.
4. Use your solution to the equation of motion to find  $r(t)$  in the limit that  $\omega$  goes to zero and show that it is consistent with simple kinematics.

**Problem 3.** *Problem 7.29 from Classical Mechanics by J. R. Tylor*

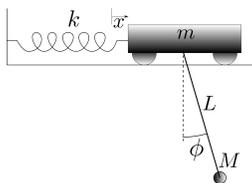

A simple pendulum (mass  $m$ , length  $l$ ) whose point of support  $P$  is attached to the edge of a wheel (center  $O$ , radius  $R$ ) that is forced to rotate at a fixed angular velocity  $\omega$ . At  $t = 0$ , the point  $P$  is level with  $O$  on the right. Write down the Lagrangian and find the equation of motion for the angle  $\phi$ . Check that your answer makes sense in the special case that  $\omega = 0$ . [See the problem 7.29 in Tylor for hints.]

**Problem 4.** *Problem 7.31 from Classical Mechanics by J. R. Tylor*

A simple pendulum (mass  $M$ , length  $L$ ) is suspended from a cart (mass  $m$ ) that can oscillate on the end of the spring of force constant  $k$ .

1. Write the Lagrangian in terms of the two generalized coordinates  $x$  and  $\phi$ , where  $x$  is the extension of the spring from the its equilibrium length. Find the two Lagrange equations. (Warning: They're pretty ugly!)
2. Simplify the equations of motion for the case that both  $x$  and  $\phi$  are small. (They're still pretty ugly, and still are coupled.)

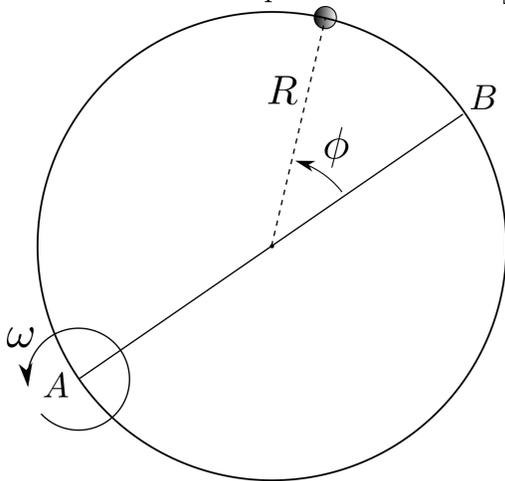

## Homework 11. Due November 04, at 9:20 am.

**Problem 1.** *Problem 7.33 from Classical Mechanics by J. R. Tylor*

A bar of soap (mass  $m$ ) is at rest on a frictionless plate that rests on a horizontal table. At time  $t = 0$ , I start raising one edge of the plate so that the plate pivots about the opposite edge with constant angular velocity  $\omega$ , and the soap starts to slide toward the downhill edge. Show that the equation of motion for the soap has the form  $\ddot{x} - \omega^2 x = -g \sin(\omega t)$ , where  $x$  is the soap's distance from the downhill edge. Solve this for  $x(t)$ , given that  $x(0) = x_0$ . [See the problem 7.33 in Tylor for hints.]

**Problem 2.** *Problem 7.35 from Classical Mechanics by J. R. Tylor*

The figure shows top view of a smooth horizontal wire hoop that is forced to rotate at a fixed angular velocity  $\omega$  about a vertical axis through the point  $A$ . A bead of mass  $m$  is threaded on the hoop and is free to move around it, with its position specified by the angle  $\phi$  that it makes at the center with the diameter  $AB$ . Find the Lagrangian for this system using  $\phi$  as your generalized coordinate. Use the Lagrangian equations of motion to show that the bead oscillates about point  $B$  exactly like a simple pendulum. What is the frequency of these oscillations if their amplitude is small? [See the problem 7.35 in Tylor for hints.]

**Problem 3.** *Problem 7.48 from Classical Mechanics by J. R. Tylor*

Let  $F(q_1, \dots, q_n)$  be any function of the generalized coordinates  $(q_1, \dots, q_n)$  of a system with Lagrangian  $L(q_1, \dots, q_n, \dot{q}_1, \dots, \dot{q}_n, t)$ . Prove directly, by writing the equations of motion that the two Lagrangians  $L$  and  $L' = L + dF/dt$  give exactly the same equations of motion.

**Problem 4.** *Problem 7.49 from Classical Mechanics by J. R. Tylor*

Consider a particle of mass  $m$  and charge  $q$  moving in a uniform constant magnetic field  $\vec{B}$  in the  $z$  direction.

1. Prove, that  $\vec{B}$  can be written as  $\vec{B} = \nabla \times \vec{A}$  with  $\vec{A} = \frac{1}{2}\vec{B} \times \vec{r}$ . Prove equivalently, that in cylindrical coordinates,  $\vec{A} = \frac{1}{2}B\rho\hat{\phi}$ .
2. Write the Lagrangian in cylindrical polar coordinates and find the three corresponding Lagrange equations.

3. Describe (shortly!) those solutions of the Lagrange equations in which  $\rho$  is constant.

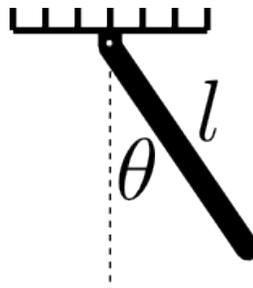

[See the problem 7.49 in Tylor for hints.]

## Homework 12. Due November 11, at 9:20 am.

### Problem 1. 1986-Spring-CM-U-2.

A “physical pendulum” is constructed by hanging a thin uniform rod of length  $l$  and mass  $m$  from the ceiling as shown in the figure. The hinge at ceiling is frictionless and constrains the rod to swing in a plane. The angle  $\theta$  is measured from the vertical.

1. Find the Lagrangian for the system.
2. Use Euler-Lagrange differential equation(s) to find the equation(s) of motion for the system. (BUT DON'T SOLVE).
3. Find the approximate solution of the Euler-Lagrange differential equation(s) for the case in which the maximum value of  $\theta$  is small.
4. Find the Hamiltonian  $H(p, q)$  for the system.
5. Use the canonical equations of Hamilton to find the equations of motion for the system and solve for the case of small maximum angle  $\theta$ . Compare your results with b. and c.

### Problem 2. 1985-Spring-CM-G-5

A bead slides without friction on a wire in the shape of a cycloid:

$$x = a(\theta - \sin \theta)$$

$$y = a(1 + \cos \theta)$$

1. Write down the Hamiltonian of the system.
2. Derive Hamiltonian's equations of motion.

**Problem 3.** *Problem 7.37 from Classical Mechanics by J. R. Tylor*

Two equal masses  $m_1 = m_3 = m$ , are joined by a massless string of length  $L$ , that passes through a hole in a frictionless horizontal table. The first mass slides on the table with the second hangs below the table and moves up and down in a vertical line.

1. Assuming that the string remains taut, write down the Lagrangian for this system in terms of polar coordinates  $(r, \phi)$  of the mass on the table.
2. Find the two Lagrangian equations of motion and interpret the  $\phi$  equation in terms of the angular momentum  $l$  of the first mass.
3. Express  $\dot{\phi}$  in terms of  $l$  and eliminate  $\dot{\phi}$  from the  $r$  equation. Now use the  $r$  equation to find the value  $r = r_0$  at which the first mass can move in a circular path. Interpret your answer in Newtonian terms.
4. Suppose the first mass is moving in a circular path and is given a small radial nudge. Write  $r(t) = r_0 + \epsilon(t)$ , and rewrite the  $r$  equation in terms of  $\epsilon(t)$  dropping all powers of  $\epsilon(t)$  higher than linear. Show, that the circular path is stable and that  $r(t)$  oscillates about  $r_0$ .
5. Find the frequency of these oscillations.

**Problem 4.** *Problem 7.41 from Classical Mechanics by J. R. Tylor*

Consider a bead of mass  $m$  sliding without friction on a wire that is bent in the shape of a parabola  $z = k\rho^2$ , which is spun with constant angular velocity  $\omega$  about its vertical axis  $z$ .

1. Use cylindrical polar coordinates and write down the Lagrangian in terms of  $\rho$  as the generalized coordinate.
2. Find the equation of motion of the bead and determine whether there are positions of equilibrium, that is, values of  $\rho$  at which the bead can remain fixed, without sliding up or down the spinning wire.
3. Find out the conditions at which the equilibrium points you found are stable.

## Homework 13. The last one. Due November 18, at 9:20 am.

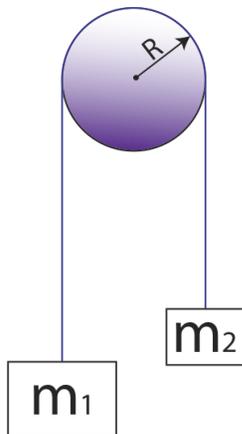

**Problem 1.** *Problem 13.2 from Classical Mechanics by J. R. Tylor*

Consider a mass  $m$  constrained to move in a vertical line under the influence of gravity. Using the coordinate  $x$  measured vertically down from a convenient origin  $O$ , write down the Lagrangian  $L$  and find the generalized momentum  $p = \partial L / \partial \dot{x}$ . Find the Hamiltonian  $H$  as a function of  $x$  and  $p$ , and write down the Hamiltonian's equations of motion.

**Problem 2.** *Problem 13.3 from Classical Mechanics by J. R. Tylor*

Consider the Atwood machine, but suppose that the pulley is a uniform disc of mass  $M$  and radius  $R$ . Using  $x$  as you generalized coordinate,

1. Write down the Lagrangian.
2. Write down the generalized momentum  $p$ , and the Hamiltonian  $H$ .
3. Find Hamilton's equations and use them to find the acceleration  $\ddot{x}$ .

**Problem 3.** *Problem 13.5 from Classical Mechanics by J. R. Tylor*

A bead of mass  $m$  is threaded on a frictionless wire that is bent into a helix with cylindrical polar coordinates  $(\rho, \phi, z)$  satisfying  $z = c\phi$  and  $\rho = R$ , with  $c$  and  $R$  constants. The  $z$  axis points vertically up and gravity vertically down. Using  $\phi$  as your generalized coordinate,

1. Write down the kinetic and potential energies.
2. Write down the Hamiltonian  $H$ .
3. Write down the Hamiltonian's equations and solve for  $\ddot{\phi}$  and hence  $\ddot{z}$ .
4. Explain your result in terms of Newtonian dynamics.
5. Consider a special case  $R = 0$ .

**Problem 4.** *Problem 13.6 from Classical Mechanics by J. R. Tylor*

Consider the well-known problem of a cart of mass  $m$  moving along the  $x$  axis attached to a spring (force constant  $k$ ), whose other end is held fixed. Take the spring to be uniform and of mass  $M$ . Use the spring's extension  $x$  as generalized coordinate.

1. Write down the Hamiltonian.
2. Write down the Hamiltonian equations of motion.
3. Solve the equations and find out the frequency of the oscillations.

**Problem 5. Extra for Honors**

A parallel plate capacitor is charged so that the electric field inside is  $\mathcal{E}_0$ . A ball of mass  $m$  and charge  $q$  is bouncing vertically off the lower plate without loss of energy and charge transfer. Its initial energy  $E_0$  is such, that it never reaches the top plate. Neglect the gravity.

- What is the height  $x_{E_0}$  (measured from the lower plate) of the ball's trajectory initially as a function of its energy, mass, and charge?
- Write the Lagrangian for the ball's motion using its height as the coordinate  $x$ .
- Write the Hamiltonian for the ball's motion.
- Write the adiabatic invariant for the ball's motion in terms of energy, electric field, mass and charge of the ball.
- The electric field in the capacitor is increased very slowly to the value  $\mathcal{E} = 8\mathcal{E}_0$ . What is the energy  $E$  of the ball now in terms of the initial energy  $E_0$ ?
- What is the height of the ball's trajectory  $x_E$  in terms of the initial height  $x_{E_0}$ ?
