Where in the world are major environmental changes?

Investigation Overview

This investigation introduces students to the significant environmental changes occurring around the world. The investigation uses NASA satellite images of Brazil to illustrate deforestation as one type of environmental change. Students learn that satellite images provide useful information to interpret, understand, plan, and predict environmental changes.

Time required: Three or four 45-minute sessions

Content Preview

Deforestation is a significant environmental change in several regions of the world. Extensive tree removal often results in widespread habitat destruction. Large-scale reductions in vegetation may also lead to climate change. Deforestation in Rondonia, Brazil, as recorded by NASA imagery. provides a useful case study of a major environmental change.

Classroom Procedures Beginning the Investigation

If you have completed an earlier investigation in this module, proceed directly to 3.

1. Have students develop a list of topics that NASA scientists study. Share the list with the class. Discuss the topics presented and havestudents identify which topics are local issues and which are global issues.

Geography Standards

Standard 4: Places and Regions

The physical and human characteristics of places

· Analyze the physical characteristics of places.

Standard 14: Environment and Society

How human actions modify the physical environment

 Analyze the environmental consequences of human changes of the physical environment.

Standard 15: Environment and Society

How physical systems affect human systems

 Analyze ways in which human systems develop in response to conditions in the physical environment.

Geography Skills Skill Set 1: Ask Geographic Questions

· Identify geographic issues, define geographic problems, and pose geographic questions.

Skill Set 2: Acquire Geographic Information

• Use maps to collect and/or compile geographic information.

Skill Set 3: Organize Geographic Information

• Prepare various forms of maps as a means of organizing geographic information.

Skill Set 4: Analyze Geographic Information

 Interpret information from maps and satellite images.

Skill Set 5: Answer Geographic Questions

· Make generalizations and assess their validity.

- Using the class discussion as a starting point, explain to students that NASA scientists study many topics and use photos and data gathered by airplanes as well as images and data gathered by satellites.
- 3. Distribute and have students read the **Briefing**.
- 4. Divide the class into groups of 3–4 students. Each group should have a recorder/reporter. Explain to students that some environmental changes negatively affect a large proportion of Earth's population, influence large areas of Earth, endure for a long time, and require the cooperation of many societies to solve or improve. If possible, have students explore the following web site on environmental change. See http://edcwww.cr.ussg.gov/earthshots/slow/tableofcontents.
- 5. Distribute Log 1. Ask students to identify, list, and discuss issues that they believe are major environmental changes. Responses may include: global warming, ozone depletion, removal of rainforests, water pollution, air pollution, loss of land to city expansion, rapid population growth, and resource depletion. Ask students to consider the advantages and disadvantages of the environmental changes to human populations in the affected areas. Ask them to refine their lists by evaluating each major environmental change with respect to the following four traits:
 - the portion of the world's population involved in the change,
 - the area of Earth influenced by the change,
 - · the length of time that the effects endure, and
 - the number of countries required to solve or improve the conditions related to the change.
- Group recorders report to the entire class the results of the small-group discussions, and the whole class compiles a comprehensive list of global/major environmental issues. These could be displayed for future reference.

Developing the Investigation

7. Ask each group of students to use world atlases and outline maps of the world to locate where each environmental change they identified is occurring. A change may be occurring in one or several

locations. For example, a major earthquake may occur at a single location, whereas a severe drought may affect many countries.

Using the atlases, students should give the latitude and longitude of the locations and a brief description of the physical characteristics of the regions where the environmental changes are occurring. Some changes will be more difficult to pinpoint than others. For example, warming of Earth's atmosphere may occur nearly everywhere rather than at just one or a few locations.

8. Distribute Log 2. Explain that human activities fulfill basic needs and have intended and unintended consequences on natural environments. For example, cutting portions of tropical rainforests to obtain valuable wood for export and clearing land for cattle grazing and settlements may have intended consequences of creating wealth for lumber companies and livestock owners and of offering places to live for migrating people. On the other hand, unintended consequences may include destroying species of wildlife dependent on the rainforest and altering climate in the region.

Concluding the Investigation

 Distribute Log 3. Students have thought about environmental problems based on prior knowledge and class discussion, and they have mapped the problems they identified. Tropical rainforest destruction is a major environmental change. Images include selections from http://edcwww.cr.usgs.gov/earthshots/slow/tableofcontents> depicting Rondonia, Brazil.

Background

To survive people depend on the physical environment. They adapt to it and modify it to suit their changing needs for things such as food, clothing, water, shelter, energy, and recreational facilities. In meeting their needs, they bring knowledge and technology to bear on physical systems. Clearing land for settlement, mining, and agriculture provides homes and livelihoods for some but alters physical systems and transforms human populations, wildlife, and vegetation. See *Geography for Life: National Geography Standards* 1994, p. 92.

Tropical Deforestation in Rondonia, Brazil

Approximately 30 percent (3,562,800 square kilometers) of the world's tropical forests are in Brazil. The estimated average deforestation rate from 1978 to 1988 was 15,000 square kilometers per year. Systematic cutting of forest vegetation starts along roads and then fans out to create the "feather" or "fishbone" pattern. The deforested land and urban areas appear in light blue; healthy vegetation appears red. See http://edcwww.cr.usgs.gov/earthshots/slow/Rondonia/Rondonia/.

In Rondonia the forests are a resource for commercial logging. Valuable trees are cut and sold. Remaining trees may be burned along with other vegetation. Commercial cattle raising and farm settlements are other important reasons for deforestation in tropical rainforests. As the trees and other vegetation are removed, wildlife habitat is destroyed. Sometimes isolated forest parcels are left by deforestation, causing plants and animals to be cut off from the larger forest area. Large-scale forest removal threatens species and alters climate characteristics.

When land in Rondonia was opened for development by building a road through the forest, many settlers carved through the forest along regularly spaced, perpendicular roads from the main transportation artery. They created a fishbone pattern of deforestation. The fishbone pattern has the effect of dividing the remaining forest into many small parcels, providing very little undisturbed forest for wildlife in between. What would have happened if a different pattern of clearing had been used such as a hub-and-spoke pattern? If a hub and spoke were used, the undisturbed areas would have been larger and wildlife would have been less threatened by development. If sections were designated as preserves on which no development could occur, the possibility of species preservation would be even greater.

The actual rate of deforestation is difficult to determine and has been the focus of NASA-funded study for many years. NASA projects to investigate the deforestation of tropical forests are conducted by analyzing satellite images to determine the area of forest that has been cleared. http://www.bsrsi.msu.edu/rfrc/deforestation.html

Evaluation

Log 1

Students will add issues to the Environmental Changes Checklist that they identify as major environmental changes. The issues on the checklist will vary among students. The following is a sample of some possible environmental changes.

Environmental Changes

Changes	A y n		B y n		C y n		D y n	
Air pollution from burning fuels	•		•		•		•	
Thinning of ozone layer	•		•		•		•	
Oil spills in the ocean		•		•	•		•	
Cutting down tropical rainforests	•		•		•		•	
Rapid population growth on Earth	•		•		•		•	

Log 2

Students develop their own answers to questions concerning basic human material needs. For example in Question 1, "What are the basic material needs that all people have?" Students could answer, "Food, shelter, and water" or "Hamburgers, french fries, and milkshakes." Any answers that they provide should then be used to complete the remaining questions. Students should not be expected to have identical answers.

Log 3

- In the 1992 image, there are more settlements than in 1975, as shown by the increase in blue areas. Light red streaks are apparent in the 1992 image but not in the 1975 image, indicating deforestation.
- 2. The pattern of deforestation in the 1992 image is in long, narrow lines that stay about the same distance apart all along the length of the lines. This is a fishbone pattern.
- Valuable species of trees are cut and sold by commercial loggers. The remaining trees and vegetation are often burned, clearing land for growing crops, raising livestock, and building houses and stores.
- 4. Animals that need large expanses of forest to live may be at a disadvantage as the forest is broken up into long, parallel strips. They may be forced to remaining parts of the forest to search for food and shelter, or they may become endangered or extinct.
- 5. One pattern that might preserve large areas of forest is a hub and spoke pattern similar to a wagon wheel. A central settlement with roads running out in different directions might preserve large areas of land for wildlife that would remain connected to the whole forest. Students may suggest other patterns.
- The pattern suggested in Question 5 might be better than the pattern in the 1992 image because it would preserve large areas of forest while still allowing new settlement and tree cutting.

- 7. Deforestation in Rondonia affects other places. For example, trees are sold to make products sold in other locations. People who settle in the newly cleared forest come from other places. Also, extensive deforestation and burning causes changes in atmospheric gases such as carbon dioxide. Loss of plant species that may have had medicinal benefits also occurs.
- 8. People might make products from materials in the forest without cutting the trees or they might grow crops that require less tree removal.

Concluding Activity

Sample ideas for short essay topics:

Advantages: More space for humans to live, income from farming or mining cleared land, income from selling valuable trees

Disadvantages: Species of plants and animals may decline or become extinct, harmful changes might occur in atmospheric gases

Module 3, Investigation 4: BriefingWhere in the world are major environmental changes?

Background

Many environmental changes are interconnected on a global scale. For example diseases that originate in one place may threaten populations in other places as people migrate from region to region. Also, unusual climate and weather conditions may destroy crops in one country and create bumper crops in another country. Serious food shortages may occur in one place and surpluses in another. Moving food over long distances may be required to avoid starvation and malnutrition. NASA scientists are interested in monitoring environmental changes on Earth's surface so that their consequences can be understood and predicted. Environmental changes often affect human well-being.

Human activities on Earth's surface have intended and unintended consequences. For example, cutting portions of tropical rainforests to obtain valuable wood for export to other countries, clearing land for cattle grazing, and settlements may result in creating wealth for lumber companies and livestock owners and in providing places to live for migrating people. Unintended consequences may include destroying species of wildlife dependent on the rainforest and altering Earth's climate. Unintended consequences may not be understood in time to repair the negative environmental changes.

In this investigation, you consider what makes up a major environmental change and then look at deforestation as an example. Deforestation is a major research topic for NASA scientists.

Objectives

In this investigation you will

- describe several major environmental changes,
- locate places in the world where major environmental changes are occurring,
- give reasons why an environmental change may be classified major,
- describe issues related to deforestation in a tropical region,
- offer ways to remedy some of the negative consequences of deforestation,
- · describe features on thermal images, and
- explain why NASA scientists study environmental changes.

Procedures for the Investigation

You identify and classify examples of major environmental changes on Earth's surface. You use atlases to locate places where the environmental changes are occurring and describe the features of those places. You examine remotely sensed images of Brazil's forests to identify patterns of deforestation and speculate about what caused the patterns and how they might be changed.

Module 3, Investigation 4: Log 1

Where in the world are major environmental changes?

For this investigation, your class will be divided into groups to consider different types of environmental changes and issues. Each group should have a recorder/reporter who will share group findings with the entire class.

Many environmental changes negatively affect a large proportion of Earth's human population, influence large areas of Earth's surface, endure for a long time, and require the cooperation of many societies to solve or improve. Working in your groups, identify and list issues that you believe are major environmental changes. Once you have identified your list, enter them below and compare each environmental change on the list against the following traits. Does each environmental change have the four traits? Air pollution from burning fuels is given as an example below.

Traits

- a. A significant portion of the world's population is involved in the change.
- b. Large areas of Earth are influenced by the change.
- c. The problem has effects that endure a long time.
- d. The cooperation of several countries may be required to solve or improve the conditions related to change.

Group recorders report to the class, and differences and similarities are discussed.

Environmental Changes Checklist

Changes	Tra Yes	it a No	Tra Yes	Frait b Trait c		Trait d Yes No	
Air pollution	•		•		•	•	

Module 3, Investigation 4: Log 2Where in the world are major environmental changes?

Think about and answer these general questions.

1.	What are the basic material needs that all people have?
2.	What are the resources that people use to fulfill basic needs?
3.	How do people get these resources?
4.	How does getting needed resources affect the natural environment? Provide examples.
_	Lieu de the manufacture of any manufacture that all any manufacture and a Company of the second of t
5.	How do the resource choices of one group affect other people? Provide examples.

Module 3, Investigation 4: Log 3

Where in the world are major environmental changes?

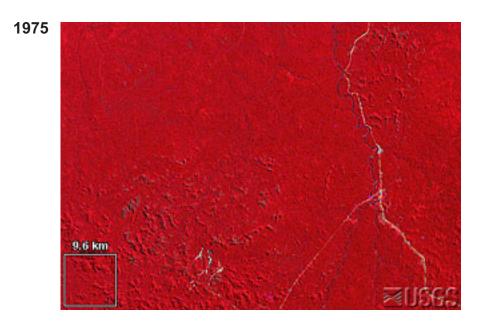

1.	Describe two differences that are observed between the 1975 and 1992 images. 1)
	2)
2.	Describe the pattern of deforestation that you see on the 1992 image.
3.	What human activities created the pattern?
4.	If animal populations need large expanses of natural forest to live and reproduce, what would be the effects of the change in land use patterns on animal populations?
5.	Using the image as a model, on a separate sheet of paper, do a sketch map of a pattern that you think would be better to preserve wildlife habitat and still allow some settlement activity in the region. Is there a better way to develop the forest and still provide for the needs of animals?

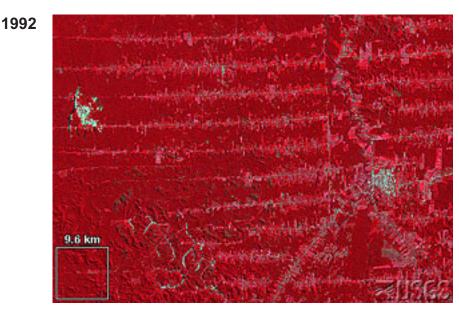

Module 3, Investigation 4: Log 3Where in the world are major environmental changes?

Dark red indicates forested areas. Light red indicates deforested areas. Light blue shows settlements.

Notice that in the 1975 image there is a line of light red and some small blue dots. These represent a road through the forest and some small settlements. Little deforestation had taken place in this area of Rondonia. Now examine the 1975 and 1992 satellite images of Rondonia, Brazil. Both images are from Landsat.

Source: http://edcwww.cr.usgs.gov/earthshots/slow/Rondonia/Rondonia

Module 3, Investigation 4: Log 3Where in the world are major environmental changes?

6.	Why do you think your proposed pattern would be better than the current pattern on the 1992 image?
7.	Does deforestation in Rondonia affect other places? How?
8.	Are there some other ways that basic needs might be met that would have less impact on the environment?

Concluding the Activity

Using what you have learned in this investigation, develop a short essay on the following question: What are the advantages and disadvantages for people when forests are cut down?
