Linear Algebra

**Lecture 15:**  
**Kernel and range.**  
**General linear equation.**  
**Matrix transformations.**

## Linear transformation

*Definition.* Given vector spaces  $V_1$  and  $V_2$ , a mapping  $L : V_1 \rightarrow V_2$  is **linear** if

$$L(\mathbf{x} + \mathbf{y}) = L(\mathbf{x}) + L(\mathbf{y}),$$

$$L(r\mathbf{x}) = rL(\mathbf{x})$$

for any  $\mathbf{x}, \mathbf{y} \in V_1$  and  $r \in \mathbb{R}$ .

*Basic properties of linear mappings:*

- $L(r_1\mathbf{v}_1 + \cdots + r_k\mathbf{v}_k) = r_1L(\mathbf{v}_1) + \cdots + r_kL(\mathbf{v}_k)$   
for all  $k \geq 1$ ,  $\mathbf{v}_1, \dots, \mathbf{v}_k \in V_1$ , and  $r_1, \dots, r_k \in \mathbb{R}$ .
- $L(\mathbf{0}_1) = \mathbf{0}_2$ , where  $\mathbf{0}_1$  and  $\mathbf{0}_2$  are zero vectors in  $V_1$  and  $V_2$ , respectively.
- $L(-\mathbf{v}) = -L(\mathbf{v})$  for any  $\mathbf{v} \in V_1$ .

## Examples of linear mappings

- *Scaling*  $L : V \rightarrow V$ ,  $L(\mathbf{v}) = s\mathbf{v}$ , where  $s \in \mathbb{R}$ .

$$L(\mathbf{x} + \mathbf{y}) = s(\mathbf{x} + \mathbf{y}) = s\mathbf{x} + s\mathbf{y} = L(\mathbf{x}) + L(\mathbf{y}),$$

$$L(r\mathbf{x}) = s(r\mathbf{x}) = r(s\mathbf{x}) = rL(\mathbf{x}).$$

- *Dot product with a fixed vector*

$$\ell : \mathbb{R}^n \rightarrow \mathbb{R}, \ell(\mathbf{v}) = \mathbf{v} \cdot \mathbf{v}_0, \text{ where } \mathbf{v}_0 \in \mathbb{R}^n.$$

$$\ell(\mathbf{x} + \mathbf{y}) = (\mathbf{x} + \mathbf{y}) \cdot \mathbf{v}_0 = \mathbf{x} \cdot \mathbf{v}_0 + \mathbf{y} \cdot \mathbf{v}_0 = \ell(\mathbf{x}) + \ell(\mathbf{y}),$$

$$\ell(r\mathbf{x}) = (r\mathbf{x}) \cdot \mathbf{v}_0 = r(\mathbf{x} \cdot \mathbf{v}_0) = r\ell(\mathbf{x}).$$

- *Cross product with a fixed vector*

$$L : \mathbb{R}^3 \rightarrow \mathbb{R}^3, L(\mathbf{v}) = \mathbf{v} \times \mathbf{v}_0, \text{ where } \mathbf{v}_0 \in \mathbb{R}^3.$$

- *Multiplication by a fixed matrix*

$$L : \mathbb{R}^n \rightarrow \mathbb{R}^m, L(\mathbf{v}) = A\mathbf{v}, \text{ where } A \text{ is an } m \times n \text{ matrix and all vectors are column vectors.}$$

## Linear mappings of functional vector spaces

- *Evaluation at a fixed point*

$$\ell : F(\mathbb{R}) \rightarrow \mathbb{R}, \quad \ell(f) = f(a), \quad \text{where } a \in \mathbb{R}.$$

- *Multiplication by a fixed function*

$$L : F(\mathbb{R}) \rightarrow F(\mathbb{R}), \quad L(f) = gf, \quad \text{where } g \in F(\mathbb{R}).$$

- *Differentiation*  $D : C^1(\mathbb{R}) \rightarrow C(\mathbb{R}), \quad L(f) = f'.$

$$D(f + g) = (f + g)' = f' + g' = D(f) + D(g),$$

$$D(rf) = (rf)' = rf' = rD(f).$$

- *Integration over a finite interval*

$$\ell : C(\mathbb{R}) \rightarrow \mathbb{R}, \quad \ell(f) = \int_a^b f(x) dx, \quad \text{where}$$

$$a, b \in \mathbb{R}, \quad a < b.$$

## Properties of linear mappings

- If a linear mapping  $L : V \rightarrow W$  is invertible then the inverse mapping  $L^{-1} : W \rightarrow V$  is also linear.
- If  $L : V \rightarrow W$  and  $M : W \rightarrow X$  are linear mappings then the composition  $M \circ L : V \rightarrow X$  is also linear.
- If  $L_1 : V \rightarrow W$  and  $L_2 : V \rightarrow W$  are linear mappings then the sum  $L_1 + L_2$  is also linear.

## Linear differential operators

- an ordinary differential operator

$$L : C^\infty(\mathbb{R}) \rightarrow C^\infty(\mathbb{R}), \quad L = g_0 \frac{d^2}{dx^2} + g_1 \frac{d}{dx} + g_2,$$

where  $g_0, g_1, g_2$  are smooth functions on  $\mathbb{R}$ .

That is,  $L(f) = g_0 f'' + g_1 f' + g_2 f$ .

- Laplace's operator  $\Delta : C^\infty(\mathbb{R}^2) \rightarrow C^\infty(\mathbb{R}^2)$ ,

$$\Delta f = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2}$$

(a.k.a. the Laplacian; also denoted by  $\nabla^2$ ).

## Range and kernel

Let  $V, W$  be vector spaces and  $L : V \rightarrow W$  be a linear mapping.

*Definition.* The **range** (or **image**) of  $L$  is the set of all vectors  $\mathbf{w} \in W$  such that  $\mathbf{w} = L(\mathbf{v})$  for some  $\mathbf{v} \in V$ . The range of  $L$  is denoted  $L(V)$ .

The **kernel** of  $L$ , denoted  $\ker L$ , is the set of all vectors  $\mathbf{v} \in V$  such that  $L(\mathbf{v}) = \mathbf{0}$ .

**Theorem** (i) The range of  $L$  is a subspace of  $W$ .  
(ii) The kernel of  $L$  is a subspace of  $V$ .

*Example.*  $L : \mathbb{R}^3 \rightarrow \mathbb{R}^3$ ,  $L \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} 1 & 0 & -1 \\ 1 & 2 & -1 \\ 1 & 0 & -1 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix}$ .

The kernel  $\ker L$  is the nullspace of the matrix.

$$L \begin{pmatrix} x \\ y \\ z \end{pmatrix} = x \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix} + y \begin{pmatrix} 0 \\ 2 \\ 0 \end{pmatrix} + z \begin{pmatrix} -1 \\ -1 \\ -1 \end{pmatrix}$$

The range  $f(\mathbb{R}^3)$  is the column space of the matrix.

*Example.*  $L : \mathbb{R}^3 \rightarrow \mathbb{R}^3$ ,  $L \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} 1 & 0 & -1 \\ 1 & 2 & -1 \\ 1 & 0 & -1 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix}$ .

The range of  $L$  is spanned by vectors  $(1, 1, 1)$ ,  $(0, 2, 0)$ , and  $(-1, -1, -1)$ . It follows that  $L(\mathbb{R}^3)$  is the plane spanned by  $(1, 1, 1)$  and  $(0, 1, 0)$ .

To find  $\ker L$ , we apply row reduction to the matrix:

$$\begin{pmatrix} 1 & 0 & -1 \\ 1 & 2 & -1 \\ 1 & 0 & -1 \end{pmatrix} \rightarrow \begin{pmatrix} 1 & 0 & -1 \\ 0 & 2 & 0 \\ 0 & 0 & 0 \end{pmatrix} \rightarrow \begin{pmatrix} 1 & 0 & -1 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{pmatrix}$$

Hence  $(x, y, z) \in \ker L$  if  $x - z = y = 0$ .

It follows that  $\ker L$  is the line spanned by  $(1, 0, 1)$ .

## More examples

$$f : \mathcal{M}_2(\mathbb{R}) \rightarrow \mathcal{M}_2(\mathbb{R}), \quad f(A) = A + A^T.$$

$$f \begin{pmatrix} a & b \\ c & d \end{pmatrix} = \begin{pmatrix} 2a & b+c \\ b+c & 2d \end{pmatrix}.$$

$\ker f$  is the subspace of anti-symmetric matrices, the range of  $f$  is the subspace of symmetric matrices.

$$g : \mathcal{M}_2(\mathbb{R}) \rightarrow \mathcal{M}_2(\mathbb{R}), \quad g(A) = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix} A.$$

$$g \begin{pmatrix} a & b \\ c & d \end{pmatrix} = \begin{pmatrix} c & d \\ 0 & 0 \end{pmatrix}.$$

The range of  $g$  is the subspace of matrices with the zero second row,  $\ker g$  is the same as the range

$$\implies g(g(A)) = O.$$

## General linear equations

*Definition.* A **linear equation** is an equation of the form

$$L(\mathbf{x}) = \mathbf{b},$$

where  $L : V \rightarrow W$  is a linear mapping,  $\mathbf{b}$  is a given vector from  $W$ , and  $\mathbf{x}$  is an unknown vector from  $V$ .

The range of  $L$  is the set of all vectors  $\mathbf{b} \in W$  such that the equation  $L(\mathbf{x}) = \mathbf{b}$  has a solution.

The kernel of  $L$  is the solution set of the **homogeneous** linear equation  $L(\mathbf{x}) = \mathbf{0}$ .

**Theorem** If the linear equation  $L(\mathbf{x}) = \mathbf{b}$  is solvable then the general solution is

$$\mathbf{x}_0 + t_1 \mathbf{v}_1 + \cdots + t_k \mathbf{v}_k,$$

where  $\mathbf{x}_0$  is a particular solution,  $\mathbf{v}_1, \dots, \mathbf{v}_k$  is a basis for the kernel of  $L$ , and  $t_1, \dots, t_k$  are arbitrary scalars.

*Example.* 
$$\begin{cases} x + y + z = 4, \\ x + 2y = 3. \end{cases}$$

$$L: \mathbb{R}^3 \rightarrow \mathbb{R}^2, \quad L \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} 1 & 1 & 1 \\ 1 & 2 & 0 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix}.$$

Linear equation:  $L(\mathbf{x}) = \mathbf{b}$ , where  $\mathbf{b} = \begin{pmatrix} 4 \\ 3 \end{pmatrix}$ .

$$\left( \begin{array}{ccc|c} 1 & 1 & 1 & 4 \\ 1 & 2 & 0 & 3 \end{array} \right) \rightarrow \left( \begin{array}{ccc|c} 1 & 1 & 1 & 4 \\ 0 & 1 & -1 & -1 \end{array} \right) \rightarrow \left( \begin{array}{ccc|c} 1 & 0 & 2 & 5 \\ 0 & 1 & -1 & -1 \end{array} \right)$$

$$\begin{cases} x + 2z = 5 \\ y - z = -1 \end{cases} \iff \begin{cases} x = 5 - 2z \\ y = -1 + z \end{cases}$$

$$(x, y, z) = (5 - 2t, -1 + t, t) = (5, -1, 0) + t(-2, 1, 1).$$

*Example.*  $u''(x) + u(x) = e^{2x}$ .

Linear operator  $L : C^2(\mathbb{R}) \rightarrow C(\mathbb{R})$ ,  $Lu = u'' + u$ .

Linear equation:  $Lu = b$ , where  $b(x) = e^{2x}$ .

It can be shown that the range of  $L$  is the entire space  $C(\mathbb{R})$  while the kernel of  $L$  is spanned by the functions  $\sin x$  and  $\cos x$ .

Particular solution:  $u_0 = \frac{1}{5}e^{2x}$ .

Thus the general solution is

$$u(x) = \frac{1}{5}e^{2x} + t_1 \sin x + t_2 \cos x.$$

## Matrix transformations

Any  $m \times n$  matrix  $A$  gives rise to a transformation  $L : \mathbb{R}^n \rightarrow \mathbb{R}^m$  given by  $L(\mathbf{x}) = A\mathbf{x}$ , where  $\mathbf{x} \in \mathbb{R}^n$  and  $L(\mathbf{x}) \in \mathbb{R}^m$  are regarded as column vectors. This transformation is **linear**.

*Example.* 
$$L \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} 1 & 0 & 2 \\ 3 & 4 & 7 \\ 0 & 5 & 8 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix}.$$

Let  $\mathbf{e}_1 = (1, 0, 0)$ ,  $\mathbf{e}_2 = (0, 1, 0)$ ,  $\mathbf{e}_3 = (0, 0, 1)$  be the standard basis for  $\mathbb{R}^3$ . We have that  $L(\mathbf{e}_1) = (1, 3, 0)$ ,  $L(\mathbf{e}_2) = (0, 4, 5)$ ,  $L(\mathbf{e}_3) = (2, 7, 8)$ . Thus  $L(\mathbf{e}_1)$ ,  $L(\mathbf{e}_2)$ ,  $L(\mathbf{e}_3)$  are columns of the matrix.

**Problem.** Find a linear mapping  $L : \mathbb{R}^3 \rightarrow \mathbb{R}^2$  such that  $L(\mathbf{e}_1) = (1, 1)$ ,  $L(\mathbf{e}_2) = (0, -2)$ ,  $L(\mathbf{e}_3) = (3, 0)$ , where  $\mathbf{e}_1, \mathbf{e}_2, \mathbf{e}_3$  is the standard basis for  $\mathbb{R}^3$ .

$$\begin{aligned}L(x, y, z) &= L(x\mathbf{e}_1 + y\mathbf{e}_2 + z\mathbf{e}_3) \\ &= xL(\mathbf{e}_1) + yL(\mathbf{e}_2) + zL(\mathbf{e}_3) \\ &= x(1, 1) + y(0, -2) + z(3, 0) = (x + 3z, x - 2y)\end{aligned}$$

$$L(x, y, z) = \begin{pmatrix} x + 3z \\ x - 2y \end{pmatrix} = \begin{pmatrix} 1 & 0 & 3 \\ 1 & -2 & 0 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$

Columns of the matrix are vectors  $L(\mathbf{e}_1), L(\mathbf{e}_2), L(\mathbf{e}_3)$ .

**Theorem** Suppose  $L : \mathbb{R}^n \rightarrow \mathbb{R}^m$  is a linear map. Then there exists an  $m \times n$  matrix  $A$  such that  $L(\mathbf{x}) = A\mathbf{x}$  for all  $\mathbf{x} \in \mathbb{R}^n$ . Columns of  $A$  are vectors  $L(\mathbf{e}_1), L(\mathbf{e}_2), \dots, L(\mathbf{e}_n)$ , where  $\mathbf{e}_1, \mathbf{e}_2, \dots, \mathbf{e}_n$  is the standard basis for  $\mathbb{R}^n$ .

$$\mathbf{y} = A\mathbf{x} \iff \begin{pmatrix} y_1 \\ y_2 \\ \vdots \\ y_m \end{pmatrix} = \begin{pmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{pmatrix}$$

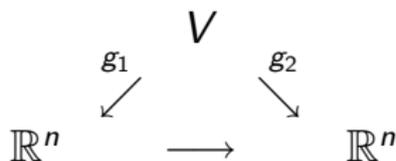

$$\iff \begin{pmatrix} y_1 \\ y_2 \\ \vdots \\ y_m \end{pmatrix} = x_1 \begin{pmatrix} a_{11} \\ a_{21} \\ \vdots \\ a_{m1} \end{pmatrix} + x_2 \begin{pmatrix} a_{12} \\ a_{22} \\ \vdots \\ a_{m2} \end{pmatrix} + \dots + x_n \begin{pmatrix} a_{1n} \\ a_{2n} \\ \vdots \\ a_{mn} \end{pmatrix}$$

## Change of coordinates

Let  $V$  be a vector space.

Let  $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$  be a basis for  $V$  and  $g_1 : V \rightarrow \mathbb{R}^n$  be the coordinate mapping corresponding to this basis.

Let  $\mathbf{u}_1, \mathbf{u}_2, \dots, \mathbf{u}_n$  be another basis for  $V$  and  $g_2 : V \rightarrow \mathbb{R}^n$  be the coordinate mapping corresponding to this basis.

The composition  $g_2 \circ g_1^{-1}$  is a linear mapping of  $\mathbb{R}^n$  to itself. It is represented as  $\mathbf{x} \mapsto U\mathbf{x}$ , where  $U$  is an  $n \times n$  matrix.

$U$  is called the **transition matrix** from  $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$  to  $\mathbf{u}_1, \mathbf{u}_2, \dots, \mathbf{u}_n$ . Columns of  $U$  are coordinates of the vectors  $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$  with respect to the basis  $\mathbf{u}_1, \mathbf{u}_2, \dots, \mathbf{u}_n$ .

## Matrix of a linear transformation

Let  $V, W$  be vector spaces and  $f : V \rightarrow W$  be a linear map.

Let  $\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_n$  be a basis for  $V$  and  $g_1 : V \rightarrow \mathbb{R}^n$  be the coordinate mapping corresponding to this basis.

Let  $\mathbf{w}_1, \mathbf{w}_2, \dots, \mathbf{w}_m$  be a basis for  $W$  and  $g_2 : W \rightarrow \mathbb{R}^m$  be the coordinate mapping corresponding to this basis.

$$\begin{array}{ccc} V & \xrightarrow{f} & W \\ g_1 \downarrow & & \downarrow g_2 \\ \mathbb{R}^n & \longrightarrow & \mathbb{R}^m \end{array}$$

The composition  $g_2 \circ f \circ g_1^{-1}$  is a linear mapping of  $\mathbb{R}^n$  to  $\mathbb{R}^m$ . It is represented as  $\mathbf{x} \mapsto A\mathbf{x}$ , where  $A$  is an  $m \times n$  matrix.

$A$  is called the **matrix of  $f$**  with respect to bases  $\mathbf{v}_1, \dots, \mathbf{v}_n$  and  $\mathbf{w}_1, \dots, \mathbf{w}_m$ . Columns of  $A$  are coordinates of vectors  $f(\mathbf{v}_1), \dots, f(\mathbf{v}_n)$  with respect to the basis  $\mathbf{w}_1, \dots, \mathbf{w}_m$ .
